library("GGally")
```

Dataset

The `penguins` dataset (available through the `palmerpenguins` package and can be loaded after installing and loading the package) contains real-world data collected from three penguin species are Adélie, Chinstrap, and Gentoo living in the Palmer Archipelago of Antarctica. The measurements were taken between 2007 and 2009 consists many variables about the penguins such as `species`, `island`, `bill_length_mm`, and so on.

Drawing a plot for association

1. Draw a single plot showing association between the bill lengths and body mass of the penguins according to the their sex (60 pts).

```
data("penguins")
head(penguins)
```

```
##   species    island bill_len bill_dep flipper_len body_mass  sex year
## 1  Adelie  Torgersen   39.1   18.7       181    3750  male 2007
## 2  Adelie  Torgersen   39.5   17.4       186    3800 female 2007
## 3  Adelie  Torgersen   40.3   18.0       195    3250 female 2007
## 4  Adelie  Torgersen    NA     NA        NA     NA   <NA> 2007
## 5  Adelie  Torgersen   36.7   19.3       193    3450 female 2007
## 6  Adelie  Torgersen   39.3   20.6       190    3650  male 2007
```

```
new_penguins <- na.omit(penguins)
```

```
ggplot(new_penguins, aes(x = bill_len , y = body_mass)) +
  geom_point() +
  facet_grid(~sex)
```

2. Interpret the plot (40 pts).

Female and male penguins have positively increasing correlation coefficients between body mass and bill lengths. Female penguins' body mass has been between 3250 and 3750. Male penguins' body mass has been between 3650 and 6250.
